## Example: Mediawiki

- `juju deploy mysql wiki-db`
- `juju deploy mediawiki demo-wiki`
- `juju deploy memcached wiki-cache`
- `juju deploy haproxy wiki-balancer`
- `juju add-relation wiki-db:db demo-wiki:db`
- `juju add-relation wiki-cache demo-wiki`
- `juju add-relation wiki-balancer:reverseproxy demo-wiki:website`
- `juju add-unit wiki-cache`
- `juju add-unit demo-wiki`

# Charms are simple

- Some yaml metadata
- A few scripts that run at the right time
- Well encapsulated
- Written with whatever tool you want!
- Assumptions can be eliminated
- Easy to read, easy to review
- <https://code.launchpad.net/charm>

```
name: mediawiki
summary: "website engine for collaborative work"
description: |
  MediaWiki is a wiki engine (a program for
  creating a collaboratively edited website). It is
  designed to handle heavy websites containing
  library-like document collections, and supports
  user uploads of images/sounds, multilingual
  content, TOC autogeneration, ISBN links, etc.
requires:
  db:
    interface: mysql
  slave:
    interface: mysql
  cache:
    interface: memcache
provides:
  website:
    interface: http
```

Charms today

nodeJS

mongoDB  
ThinkUp

HAProxy

MySQL

Jenkins

redis

# Deployment Options

- EC2 API
- Ubuntu MAAS
- Local Dev
- ??? Fully abstracted

## The Future

- Charm Store
- Subordinate Charms
- Placement Constraints
- Stacks
- Storage Management
- Cloud Federation
- Auto Scaling
- Charms, Charms, Charms, Charms...
